8. (Canceled)

9. (Currently amended) A method for documenting medical findings of a physical examination, the method comprising:

displaying a first interface including a first graphical representation of anatomical features;

accepting from a user a first selection of an anatomical feature based on the first graphical representation of anatomical features;

displaying a second interface including a second graphical representation of anatomical features and a first set of controls relating to a first plurality of medical conditions in response to accepting the first selection, the second graphical representation of anatomical features and the first set of controls displayed simultaneously without obstructing each other;

accepting from the user a second selection from the second graphical representation of anatomical features; and

displaying a third interface including a second set of controls relating to a second plurality of medical conditions.

10. (Previously presented) The method of claim 9, wherein the first graphical representation of anatomical features includes a graphical representation of a plurality of body locations.

11. (Previously presented) The method of claim 10, wherein the first selection comprises a response indicative of one of the plurality of body locations.

12. (Canceled)

13. (Canceled)

14. (Canceled)

15. (Canceled)

16. (Previously Presented) The method of claim 9, wherein the step of displaying the first interface and the step of displaying the second interface take place in different views.

17. (Previously presented) The method of claim 9, wherein displaying the second interface comprises displaying the second graphical representation in response to the first selection by the user, the first selection indicating a portion of anatomical features associated with the first graphical representation to be displayed, the second graphical representation including the portion of the anatomical features with greater detail.

18. (Currently amended) A device for documenting medical findings of a physical examination, the device comprising:

an electronically readable media for storing instructions;

a processor, associated with the electronically readable media, that executes the instructions; and

the instructions comprising:

instructions for displaying a first interface including a first graphical representation of anatomical features;

instructions for accepting from a user a first selection of an anatomical feature based on the first graphical representation of anatomical features;

instructions for displaying a second interface including a second graphical representation of anatomical features and a first set of controls relating to a first plurality of medical conditions in response to accepting the first selection, the second graphical representation of anatomical features and the first set of controls displayed simultaneously without obstructing each other;

instructions for accepting from the user a second selection from the second graphical representation of anatomical features; and

instructions for displaying a third interface including a second set of controls relating to a second plurality of medical conditions.

19. (Previously presented) The device of claim 18, wherein the first graphical representation of anatomical features includes a graphical representation of a plurality of body locations.

20. (Original) The device of 19, wherein the first selection comprises a response indicative of one of the plurality of body locations.

23. (Canceled)

24. (Canceled)

25. (Previously Presented) The device of claim 18, wherein the instructions for displaying the first interface and the instructions for displaying the second interface effect different views.

26. (Previously presented) The device of claim 18, wherein the instructions for displaying the second interface comprise instructions for displaying the second graphical representation in response to the first selection by the user, the first selection indicating a portion of the anatomical features associated with the first graphical representation to be displayed, the second graphical representation including the portion of the anatomical features in greater detail.

27. (Previously presented) The method of claim 9, wherein the second interface includes a drill down button.

28. (Previously presented) The method of claim 9, wherein the second interface includes a change system button.

29. (Previously presented) The method of claim 28, further comprising displaying a list of systems associated with the first selection in response to a user selection of the change system button.

30. (Previously presented) The method of claim 9, wherein the second interface includes a procedure button.

31. (Previously presented) The method of claim 30, further comprising displaying a list of procedures associated with the first selection in response to a user selection of the procedure button.

36. (Canceled)

37. (Canceled)

38. (Canceled)

39. (Previously presented) The method of claim 9, wherein the first set of controls includes a tri-state control configured to indicate present, not present, or not entered.

40. (Previously presented) The method of claim 9, wherein the first set of controls includes an annotation control.

41. (Previously presented) The method of claim 9, wherein the second plurality of medical conditions represents a greater level of detail than the first plurality of medical conditions.

42. (Previously presented) The method of claim 9, wherein the second interface and the third interface include a list of recent findings.

43. (Previously presented) The method of claim 9, wherein displaying the first interface, displaying the second interface, and displaying the third interface are performed on a wireless tablet computer configured for use by a physician.

44. (Previously presented) The method of claim 9, further comprising
accepting from the user a third selection, the third selection including changing one
control of the first set of controls; and
combining the first selection and the third selection to derive at least one medical finding.

45. (New) A method of documenting medical findings, the method comprising:
displaying a first interface including a first graphical representation of anatomical
features and a first plurality of tri-state controls, the first graphical representation
of anatomical features associated with a first level of detail, a first tri-state control
of the first plurality of tri-state controls associated with a first medical finding
associated with the first level of detail;
accepting from a user a first selection of an anatomical feature based on the first
graphical representation of anatomical features;
displaying in response to the first selection a second interface including a second
graphical representation of anatomical features and a second plurality of tri-state
controls, the second graphical representation of anatomical features associated
with a second level of detail, a second tri-state control of the second plurality of
tri-state controls associated with a second medical finding associated with the
second level of detail; and
accepting from the user a selected state of the second tri-state control.

46. (New) The method of claim 45, wherein the second level of detail is greater than the first level of detail.

47. (New) The method of claim 45, further comprising:
inserting an entry in a list of recent findings based on the selected state of the second tri-state control; and
displaying the list of recent findings in the second interface.

48. (New) The method of claim 47, further comprising:
accepting a selection of an item from the list of recent findings; and
providing a third interface, the third interface associated with the item from the list of recent findings.

49. (New) The method of claim 45, wherein the second tri-state control includes a word indicia indicative of an associated finding.

50. (New) The method of claim 45, further comprising displaying an interface configured to permit graphical annotation of an image associated with an anatomical feature.

51. (New) The method of claim 9, wherein the second graphical representation of anatomical features and the first set of controls are simultaneously active.
